FARM OPERATING SYSTEM

Dinotinto Farm OS

A plain-English guide to running your land, irrigation, labour, crops, costs and profit from one screen. About a 7-minute read.

What this system is for

Farm OS is your farm command centre. Instead of keeping plot sizes, irrigation costs, worker payments and crop budgets in scattered notebooks, you record them once here and the system does the maths, spots problems, and tells you what to do next. It works on a phone or computer, and your records are saved automatically.

Finding your way around

Use the menu on the left (or the menu button on a phone) to move between screens. The bar at the top has three things to know:

- **The bell** shows alerts that need attention. A red number means there are urgent items. Tap it to read them and to turn on phone/desktop push alerts.
- **Reset demo data** clears everything back to the sample farm — useful while learning, but it wipes your entries, so use it carefully.
- **Notices** appear under the top bar to confirm each thing you save.

The simple weekly rhythm

If you only remember one thing, remember this order:

1. Check the Dashboard for the big picture → **2. Open Farm Advisor** to see what needs action → **3. Assign Tasks** to workers → **4. Log work, attendance and payments** in Salary & Payroll → **5. Record costs and observations** as they happen → **6. Review Reports** at week's end.

Everything else is detail you fill in once and update occasionally (plots, irrigation materials, crop catalogue, planting plans).

Two helpers that do the thinking

Farm Advisor

Reads everything you've entered and gives you a prioritised to-do list: which plot needs clearing, what it would cost to irrigate a plot, which crop plan is heading for a loss, who is owed money, and where your biggest costs are. It also recommends the best plot for any crop you pick.

Ask AI

Type a question in normal language — “Which plot needs clearing?”, “How much will irrigation cost for Acre B?”, “What should each worker do this week?”, “What is our expected profit?” — and get an answer straight from your live records. Tap a suggested question to try it. It runs privately on your device.

Every screen, briefly

You don't need all of these at once. Set up the top few once, then live mostly in Dashboard, Advisor, Tasks, Salary and Reports.

Screen	What you do there
Dashboard	Your at-a-glance numbers — mapped acres, irrigated land, open tasks, unpaid labour, payroll balance, expected profit — plus the most urgent alerts.
Farm Advisor	Smart recommendations and the best-plot-for-a-crop picker. Start here each week.
Ask AI	Ask questions in plain language and get answers from your data.
Farm Map	Your plots/acres. Add a plot with its real measurements; the system works out the area and equivalent acres, irrigation status and land readiness.
Irrigation	List your irrigation materials and costs. The plan builder scales that list to any plot's size and gives you a materials checklist and total budget.
Land Clearing	Compare clearing methods (manual, chemical, mechanical, combined) by cost and time for a plot, then record a clearing plan.
Crop Catalog	Reference profiles for your crops — water needs, nursery time, expected yield, common pests and care tasks. Add your own crops too.
Planting Planner	Plan a crop on a plot. It checks readiness and warns you (bushy land, no irrigation, missing seed cost or market price) and forecasts profit.
Inputs & Costs	Record seeds and every input cost — fertiliser, manure, chemicals, labour, transport, fuel — against a plot or plan.
Tasks	Create jobs (clearing, planting, spraying, harvesting…), assign them to workers, set due dates and priority, and mark them done.
Workers	Add and edit workers — role, pay rate, status (active, suspended, left) — and log quick labour payments.
Salary & Payroll	Log attendance/days worked, add bonuses, deductions and advances, then run salary and track what's paid vs. owed.
Market Prices	Record current selling prices per crop so profit forecasts stay realistic.
Yield Forecast	Expected yield, marketable yield and best/worst-case revenue per crop cycle.
Observations	Log events during a cycle (pests, disease, heavy rain, delays). These feed back into cost and yield expectations.
Reports	Printable summaries: land status, irrigation coverage, profit forecast, labour, attendance, cost per plot / per worker / per category, market prices and tasks.

Alerts and push notifications

The bell collects anything urgent — a plot that needs clearing before planting, a worker who is owed money, a crop plan running at a loss. Open the bell and tap **Enable push alerts** once to also get pop-up notifications on that device for the most urgent items, even while you're on another screen. Tap an alert to mark it read, or use “Mark all read”.

Where your records are kept

Your work saves automatically as you go. Records are stored on your device and, when the database is switched on, synced to the cloud so the same data shows up across devices. If you're ever offline, the app keeps working and catches up later — you won't lose what you entered.

Five tips to get value fast

- Enter your real plot measurements first — almost every cost and forecast builds on accurate acreage.
- Keep market prices current; profit forecasts are only as good as the price you put in.
- Log costs and attendance the day they happen — it takes seconds and keeps reports honest.
- Let the Advisor set your weekly priorities instead of guessing what's urgent.
- Check Reports every week to catch rising costs and unpaid balances early.

That's the whole system at a high level. Open the Dashboard, glance at the Advisor, and you're running.
